/00/05 are PAL players

These sets are equipped with Compact Disc Mechanism type CDM9; service code 4822 691 30275. This CDM is also used in CDI205, CDI220 and CDI910. Service information is included in this manual.

(SF) Varoitus!

Laite sisältää laserdiodin, joka lähettää näkymätöntä silmille vaarallista lasersäteilyä.

(S) Varning!

Osynlig laserstrålning när denna del är öppnad och spärren är urkopplad. Betakta ej strålen.

(DK) Advarsel!

Usynlig laserstråling ved åbning når sikkerhedsafbrydere er ude af funktion. Undgå udsættelse for stråling.

(GB)

Safety regulations require that the set be restored to its original condition and that parts which are identical with those specified be used.

2.2 CONNECTION AND CONTROLS

CDI 210

DESCRIPTION OF CONTROLS AND CONNECTIONS

FRONT

1. Disc loading tray
2. Open/close button
3. Play button
4. Input port for CD-I pointing devices
5. Stop button
6. AC power on/off button
7. Soft tone multifunction display with infra-red remote control receiver

REAR

8. Mains AC (alternating current) input jack
9. Input2 port for CD-I pointing devices, keyboard or serial port
10. REMOTE (RC6) IN
11. Video output (CVBS)
12. A/V Euroconnector*
13. OUT TO TV*
14. Audio output R
15. Audio output L
16. Channel selector*
17. Extension socket (for 22ER9141)*

DISPLAY PANEL

1. CD pause active
2. Remote control active (flashing indicator)
3. Disc playing (stepping indicator)
4. Track number (CD-Audio)
5. Elapsed or remaining time (CD-Audio)
6. Type of disc indicator
7. Time indicators
8. CD scan active
9. CD repeat active
10. CD shuffle active
11. CD FTS active
12. Mute indicator

REMOTE CONTROL

1. Infra red remote control
2. Thumbstick
3. Action buttons (for left or right handed operation)
4. Play button
5. CD pause button
6. CD previous track selection button
7. Audio mute button - CD-I/TV button*
8. Volume control down button
9. Volume control up button
10. CD next track selection button
11. CD stop button

*Available on some player versions only.

Note: Pointing device speed of 9600 baud is supported.
 Remarque: Vitesse de transmission jusqu'à 9600 baud. • Nota: Se admite un dispositivo de puntero de 9600 baudios de velocidad. • Opmerking: Voor de aanwijsapparaten is een snelheid van 9600 baud mogelijk. • Hinweis: Die Geschwindigkeit der Zeigevorrichtung von 9600 baud wird unterstützt • Nota: Tollera la velocità dell'accessorio di comando di 9600 baud. • Nota: Velocidad del dispositivo de apunta admitida: 9600 baudios.

Designs and specifications are subject to change without notice. • La conception et les spécifications de ce produit sont sujet à modifications sans avis préalable. • Los diseños y las especificaciones están sujetos a cambios sin previo aviso. • Concepten en specificaties kunnen gewijzigd worden zonder voorafgaande verwittigingen. • Änderungen von Ausführung und technische Daten vorbehalten. • I disegni e le specifiche tecniche sono soggette a modifiche senza preavviso. • As especificações descritas estão sujeitas a alterações sem aviso prévio. • El diseño y las especificaciones están sujetos a cambios sin previo aviso.

2.3 BEFORE USING YOUR CD-I PLAYER

REMOVING THE TRANSIT PAD

- Press the on/off button on the player.
- Press the open/close button on the player to open the disc tray.
- Take the transit pad from the disc tray.
- Press the open/close button on the player to close the tray.
- To avoid damages to the CD-I player when transporting, keep the transit pad and reuse it whenever you are transporting the player.

REMOTE CONTROL INTERACTIVE OPERATION

For normal interactive operation, use the "thumbstick" remote control to select functions displayed on the TV screen. Simply:

- Aim the remote control at the player.
- Move the thumbstick to point the cursor arrow on the screen to the required function. The cursor arrow movement corresponds to the direction in which the stick is moved. The arrow moves faster if the stick is moved further.
- Click on one of the action buttons.

The function selected by this "point-and-click" technique is highlighted to confirm the selection.

Note: To "point-and-click" on any screen shown in this manual, any one of the four action buttons can be used. Within CD-I programs, you may find that the "■" buttons and the "■" buttons have different functions.

WIRED POINTING DEVICE OPERATION

Place the pointing device in front of the display screen, with the back (the cable end) pointed towards the screen. Now, as you roll the mouse, the trackerball or use the graphic tablet, the cursor moves in the corresponding direction on the screen.

When the cursor is positioned on the required function click on one of the action buttons.

The function selected by this "point-and-click" technique is highlighted to confirm the selection.

Note: To "point-and-click" on any screen shown in this manual, any one of the action buttons can be used. Within CD-I programs, you may find that the "■" buttons and the "■" buttons have different functions.

START-UP

- Press the power on/off button on the CD-I player, and check that the player display lights.
- Switch on the TV (and HiFi system if used).
- Select the CD-I input on the TV (and HiFi system if used).
- On the TV, the player start-up screen appears.

This screen has the following system function icons to guide and assist you. Select:

- Info if you need help during start-up, or when playing CD-Audio discs. (available on some player versions only)
- Settings to preselect your preferred start-up conditions.
- Dim to reduce the screen brightness while the system is at rest.
- Memory to refer to the intermediate results of CD-I titles and of FTS programs created for your CD-Audio discs.
- Open/close to open or close the disc tray.

INFO

(available on some player versions only)

The info screens offer help related to the operating mode. Point-and-click on the function for which you need help.

If your player offers the feature to change languages, point-and-click on the language shown at the foot of the screen to get the full list, then point-and-click on your choice.

When finished, point-and-click on OK.

2.4 SETTING UP

SETTINGS

This screen allows you to change the player's settings. You can change the player's time and date and the way they are presented. For CD-Audio discs you can set repeat to repeat the whole disc or just the current track, set the scan time to 5, 10 or 20 seconds per track, and set the player to automatically select shuffle and/or FTS.

Time

Select 24 hour or 12 hour clock.

Date

Select dd/mm/yy to present the date in day-month-year sequence. Select mm/dd/yy to present the date in month-day-year sequence.

Time/date set

If the time or date shown on the screen is wrong, select the appropriate < and > arrows to set hours, minutes, day, month and year in turn, as required.

Scan time*

Select the time you want the beginning of each audio track to play for when the scan function is activated.

Auto shuffle* and auto FTS*

For each of these functions, select "on" if you want the function to be activated automatically when a disc is loaded.

Repeat*

Select to repeat a complete audio disc or a single track when the repeat function is activated.

Default Volume setting

Select + or - to increase resp. decrease the default volume, (-3dB per step).

Note: Functions marked * are CD-Audio functions. When finished, point-and-click on OK

DIM

Selecting dim greatly reduces the brightness of the displayed picture. To restore the normal brightness simply delete the thumbstick.

On all screens shown in this manual except CD Graphics screen, dim occurs automatically if the player is not used for a while.

MEMORY

The memory screen shows the information held in memory: titles, dates and percentage of memory used. Use the scroll arrows to move up and down the list. To delete an item, click on its title and then click on delete. If you change your mind after deleting, click on undo.

When finished, point-and-click on OK.

OPEN/CLOSE

This icon shows the command you can select; open when the disc loading tray is closed, close when it is open.

CHANGING OVER TO TV

Select the desired channel or input of your TV using the controls of your TV set. When the player is switched on, its antenna signal is fed through to the TV and depending on the player-TV connection, TV reception might be interrupted automatically.

To change over to TV reception at any time in such case, press the TV/CDI button on the remote control (available with some player versions only). To return to CD-I play, press the TV/CDI button again.

SOUND LEVEL

When playing any disc adjust the sound level as required, preferably on the TV or HiFi amplifier. The volume up/down buttons on the remote control may also be used, but for each disc these controls always start at level set in the setting menu.

A suitable level must therefore first be set on the TV or HiFi amplifier.

SWITCHING OFF

- Press the on/off button on the player, and check that the player display goes off.
- Switch off the TV (and HiFi system if used).

2.5 DISC PLAY

LOADING

Point and click on open (you may also press the open/close button on the player) to open the disc loading tray.

Take the disc from its holder and place it on the tray with the label up.

Point and click on close (you may also press the open/close button on the player, or gently push the front of the tray) to close the tray.

The TV screen changes according to the type of disc.

Caution: never put more than one disc at a time into the CD-I player

UNLOADING

Point and click on open (you may also press the open/close button on the player) to open the disc loading tray. The player start-up screen reappears on the TV. Take the disc from the tray and replace it in its holder.

Point and click on close (you may also press the open/close button on the player, or gently press the front of the tray) to close the tray with or without a new disc.

Note: you may unload the disc at any time by pressing the open/close button. Unloading a CD-I disc while the CD-I program is running, will terminate the CD-I program abruptly. "Bookmarks" or intermediate results, if used by the CD-I program, might not be updated to the latest situation.

PLAYING A CD-I DISC

Note: This procedure is equal for CD BRIDGE discs, CD-I READY discs and PHOTO CDs.

Warning: When a title consist of more than one consecutive disc, a so-called "Multi-disc" title, follow the instructions for opening and closing of the tray as shown on the screen. When you use the "OPEN" button on the player the title is considered to be played wholly and any intermediate scores, settings or "Bookmarks" will not be updated. Any additional disc of the multi-disc title will not be recognised as part of it. The tray may also be closed by gently pressing the front of it.

After loading the disc, the CD-I start-up screen appears on the TV.

CD-I START-UP SCREEN

To start the CD-I program, select the play icon on the screen (you may also press the play button on the player or remote control). Using a play button will also automatically close the tray when open. (*)

The opening screen of the CD-I program now appears on the TV.

From this point, all interaction is between you and the program.

To stop at any time, select the stop or exit function provided by the CD-I program.

DISC PLAY

PLAYING A PHOTO CD

After loading the disc, the CD-I start-up screen appears on the TV.

CD-I START-UP SCREEN

To start the Photo CD program, select the 'PLAY CD-I' icon on the screen (you may also press the play button on the player or remote control). The opening screen of the Photo CD program now appears on the TV.

At the bottom of this screen a menu bar with icons is shown (fig.1). Select the -icon and the "SETTINGS" screen appears.

To select a language click on the box, the flag or the name of a country (the previous setting is replaced automatically).

Select the -icon (Return) of this screen to go back to the Photo CD opening screen.

Select the -icon (Information) (fig.2) and the "INFORMATION" screen, explaining the control buttons of the menu bar in the selected language, appears. From this point, all interaction is between you and the program.

FIG.1

FIG.2

PLAYING A CD-AUDIO DISC

note: this procedure can also be used for audio sections on 5 inch (12 cm) laser discs.

After loading the disc, the CD-Audio screen appears on the TV.

1. Track/time window: after loading, and in stop mode, this shows the total number of tracks and the total playing time. In play and pause modes, the window shows the track number and either the elapsed or the remaining track playing time. To change between elapsed and remaining time, "point-and-click" at the time shown in the window.
2. Play track bar: shows up to 10 tracknumbers and the total number of tracks. You can "point-and-click" to select any track. For discs with more than 10 tracks, the forward > and reverse < scroll arrows at the right and left of the track bar are used to move through the track list. The total number of tracks is shown in the box to the right of the bar; you can "point-and-click" on it to display the total playing time in the track/time window.
3. Program star: allows you to program a list of special tracks called a favorite track selection. When you select this star, the cursor arrow changes to a star, the FTS track bar appears above the play track bar and the save diamond appears beside the program star.
4. Scan: allows you to listen to the beginning of every track listed in the play track bar. You can set the scan time to 5, 10 or 20 seconds in the settings screen.
5. Shuffle: allows you to play the tracks in the play track bar in a random order.
6. Repeat: allows you to repeat either a track or the entire disc. You can change the repeat mode in the settings screen.
7. FTS: allows you to play favorite track selections. This icon only appears if a favorite track selection has been created for the disc that is loaded in the player.

(*) The default Volume is than Automatically set to the level selected in the SETTINGS Screen.

All the disc play control functions are shown on the screen, and can be selected as desired by "point-and-click" with your remote control. The operation of the functions is briefly explained in the following table.

Note: if auto shuffle or auto FTS has been selected on the settings screen, this function will be activated automatically.

3.1 SAFETY INSTRUCTIONS

- Safety regulations demand that the set be restored to its original condition and that components identical with the original types be used. Safety components are marked by the symbol .

All IC's and many other semi-conductors are susceptible to electrostatic discharges (ESD). Careless handling during repair can reduce life drastically. When repairing, make sure that you are connected with the same potential as the mass of the set via a wrist wrap with resistance. Keep components and tools also at this potential. For detailed information see "Handling ESD-sensitive components".

- A set to be repaired should always be connected to the mains via a suitable isolating transformer.
- never replace any modules or any other parts while the set is switched on.
- Use plastic instead of metal alignment tools. This in order to preclude short-circuit or to prevent a specific circuit form being rendered unstable.

3.2 SERVICING OF SMDs (Surface Mounted Devices)

3.2.1 General cautions on handling and storage

- Oxidation on the SMDs terminals results in poor soldering. Do not handle SMDs with bare hand.
- Avoid for storage places that are sensitive to oxidation such as places with sulfur or chlorine gas, direct sunlight, high temperatures or a high degree of humidity. As a result the capacitance or resistance value of the SMDs may be affected.
- Rough handling of circuit boards containing SMDs may cause damage to the components as well as the circuit boards. Circuit boards containing SMDs should never be bent or flexed. Different circuit board materials expand and contract at different rates when heated or cooled and the components and/or solder connections may be damaged due to the stress. Never rub or scrape chip components as this may cause the value of the component to change. Similarly, do not slide the circuit board across any surface.

3.2.2 Removal of SMDs

- Heat the solder (for 2-3 seconds) at each terminal of the chip. Small components can, by means of litz wire and a limited horizontal force, be removed with the soldering iron. They can also be removed with a solder sucker (see Fig. 1a) or
- While holding the SMD with a pair of tweezers take it off gently using the soldering iron's heat applied to each terminal (see Fig. 1b).
- Remove the excess solder on the solder lands by means of litz wire or a solder sucker (see Fig. 1c).

3.2.2.1 Caution on removal:

- When handling the soldering iron, use suitable pressure and be careful.
- When removing the chip, do not use undue force with the pair of tweezers.
- The soldering iron to be used (approx. 30 W), must preferably be provided with a thermal control (soldering temperature about 225 to 250°C).
- The chip, once removed, must **never** be used again.

Fig. 1

3.2.3 Attachment of SMDs

- Locate the SMD on the solder lands by means of tweezers and solder the component at one side. Ensure that the component is positioned well on the solder lands (see Fig. 2a).
- Next complete the soldering of the terminals of the component (see Fig. 2b).

Fig. 2

Fig. 3

3.2.3.1 Caution on attachment:

- When soldering the SMD terminals, do not touch them directly with the soldering iron. The soldering must be as quick as possible; care must be taken to avoid damage to the terminals and the body itself.
- Keep the SMD's body in contact with the printed board when soldering.
- The soldering iron to be used (approx. 30 W) must preferably be provided with a thermal control (soldering temperature about 225 to 250°C).
- Soldering should not be done outside the solder land.
- Soldering flux (of rosin) may be used but should not be acidic.
- After soldering, let the SMD cool down gradually at room temperature.
- The quantity of solder must be proportional with the size of the solder land. If the quantity is too great, the SMD might crack or the solder lands might be torn loose from the printed board (see Fig. 3).

3.3 HANDLING ESD-SENSITIVE COMPONENTS

3.3.1 Personal safety

The testing, handling and replacing of ESD-sensitive components requires special attention for personal safety. A person dealing with ESD-sensitive components should, normally speaking, be connected via a resistance to the same potential as the chassis of the set to protect him against direct contact with the supply voltage. This resistance is often applied in the connection lead of wrist wraps. If necessary, make use of an isolating transformer.

3.3.2 Storage and transport

Transport and store the circuits and PCBs in their original packages. As an alternative to the original package one may use a conductive material or special IC package which short-circuits all the pins of the component with one another. Always discharge the package before opening it.

3.3.3 Testing or handling

Work on a conductive surface when testing loose circuits and components or when transferring components and circuits from one package to another. Use a conductive wrist wrap with lead to make an electrical connection between the conductive surface and yourself via a resistance in the connection lead of the wrist wrap. Connect equipment and tools also with this conductive surface. Do not connect any signals to inputs as long as the power supply of the set to be tested is off. All the inputs that are not used should be connected either to ground or to the supply voltage. When testing, do not use any freon sprays for under-cooling of sensitive components.

3.3.4 Mounting ESD-sensitive components

Mount ESD-sensitive components only after all other components have been mounted. Make sure that the components themselves, the metal parts of the PCB, mounting equipment and mounting operator are at the same potential level as the chassis of the set. If it is impossible to ground the PCB, the mounting operator should pick the PCB up before bringing it into contact with the components to be replaced.

Special attention should be paid in regions having a dry atmosphere and when the floor is covered with a nylon carpet or such.

3.3.5 Soldering

Soldering iron tips, also those of low-voltage soldering stations, should be kept at the same potential as the components and the PCB. It is better to use solder-removing braid than solder suckers.

3.3.6 Electrostatic charges

One should stick to the precautionary measures also after the ESD-sensitive components have been mounted on the PCB. Until the sub-PCBs have been incorporated into a complete system on which the correct supply voltages are connected, the PCB is nothing more than an extension of the conductors of the components on this PCB. To prevent electrostatic discharges from passing to the components via the terminals, we recommend that you apply conductive clips or conductive tape on the terminals of the PCB.

3.3.7 Transients (switch-on phenomena)

To prevent permanent damages as a result of switch-on phenomena, no ESD-sensitive components, or PCBs populated with these components, should be inserted in or removed from test-sockets or systems with the supply voltage on. Prevent switching peaks on the mains as a consequence of switching electric equipment, relay and DC lines on and off.

3.3.8 Working environment

The work bench for the service technician should look like the one shown in the figure.

3.3.9 Replacement of the Flat Pack IC's

For replacing a component see Fig. 6 Dismounting and Mounting. Also a number of precautions and examples is given. When replacing a flat pack, rosin flux applied to the device leads will ensure a good soldered joint. Since rosin flux, when not properly heated by the soldering process, is sticky, it will attract dust which will result in component degeneration over a period of time. The removal of excess flux with a cleaner will not solve this problem because the flux is then even spread over a greater area by the cleaner. Drying of the flux can be accomplished by blowing the area with a common hair dryer for 1 or 2 minutes at a distance of approx. 10 centimeters.

CODENUMBERS FOR STANDARDIZED RESISTORS

Unless otherwise specified, all defective resistors in the circuits of the set can be replaced by standardized types, mentioned in this chapter.

VR25, VR37 high-ohmic/high-voltage resistors

type	D _{max}	L _{1 max}	L _{2 max}	d
VR25	2,5	6,5	7,5	0,6
type	D _{max}	L _{1 max}	L _{2 max}	d
VR37	3,7	9,0	10,0	0,7

Range VR25 : 100 K Ω to 22 M Ω

Range VR37 : 100 K Ω to 33 M Ω

Composition of the service number for the VR25 and VR37
Main subgroup: 4822 053 20... and 4822 053 21...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

4 for R = 100K to 910 K Ω

5 for R = 1M to 9.1 M Ω

6 for R = or > 10M

Example's:

The serv.nbr. for a VR25 resistor of 100 K Ω is 4822 053 20104

The serv.nbr. for a VR37 resistor of 33 M Ω is 4822 053 21336

PR01, PR02 and PR03 power metal film resistors

ϕD_{max}	L ₁	L _{2 max}	ϕd
2.5	6.5	8.0	0.6

ϕD_{max}	L _{1 max}	L _{2 max}	ϕd
3.9	10	11	0.8

ϕD_{max}	L _{1 max}	L _{2 max}	ϕd
5.2	16.7	17.9	0.8

Rated dissipation at T(amb) = 70 degrees :

PR01 = 1 Watt, PR02 = 2 Watt, PR03 = 3Watt

Composition of the service number for the PR01, PR02 and PR03

Main subgroup: 4822 053 10... ; 4822 053 11... and 4822 053 12...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 1 to 9,1 Ω

9 for R= 10 to 91 Ω

1 for R= 100 to 910 Ω

2 for R= 1 to 9,1 K Ω

3 for R= 10 to 91 K Ω

4 for R= 100 to 910 K Ω

5 for R= or > 1 M Ω

Example:

The serv.nbr. of a PR01 resistor of 47 Ω is: 4822 053 10479

The serv.nbr. of a PR03 resistor of 1 M Ω is: 4822 053 12105

NFR25 fusible resistors Δ

D _{max}	L _{max}	d	a ₁ + a ₂
2,5	6,5	0,6	≤ 1

Composition of the service number for the NFR25

Main subgroup: 4822 052 10...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 1 to 9,1 Ω

9 for R= 10 to 91 Ω

1 for R= 100 to 910 Ω

2 for R= 1 to 9,1 K Ω

3 for R= 10 to 91 K Ω

Example:

The service number of a resistor of 47 Ω is: 4822 052 10479

NFR25H fusible resistors Δ

D _{max}	L _{max}	d	a ₁ + a ₂
2,5	6,5	0,6	≤ 1

Composition of the service number for the NFR25H

Main subgroup: 4822 052 11...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 1 to 9,1 Ω

9 for R= 10 to 91 Ω

1 for R= 100 to 910 Ω

2 for R= 1 to 9,1 K Ω

3 for R= 10 to 91 K Ω

Example:

The service number of a resistor of 47 Ω is: 4822 052 11479

3.4 CODENUMBERS FOR STANDARDIZED RESISTORS

Unless otherwise specified, all defective resistors in the circuits of the set can be replaced by standardizes types, mentioned in this chapter.

VR25, VR37 high-ohmic/high -voltage resistors

Range VR25 : 100 KΩ to 22 MΩ
Range VR37 : 100 KΩ to 33 MΩ

Composition of the service number for the VR25 and VR37
Main subgroup: 4822 053 20... and 4822 053 21...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

4 for R = 100K to 910 KΩ
5 for R = 1M to 9.1 MΩ
6 for R = or > 10M

Example's:
The serv.nbr. for a VR25 resistor of 100 KΩ is 4822 053 20104
The serv.nbr. for a VR37 resistor of 33 MΩ is 4822 053 21336

PR01, PR02 and PR03 power metal film resistors

Rated dissipation at T(amb) = 70 degrees :
PR01 = 1 Watt, PR02 = 2 Watt, PR03 = 3Watt

Composition of the service number for the PR01, PR02 and PR03
Main subgroup: 4822 053 10... ; 4822 053 11... and 4822 053 12...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 1 to 9,1 Ω
9 for R= 10 to 91 Ω
1 for R= 100 to 910 Ω
2 for R= 1 to 9,1 KΩ
3 for R= 10 to 91 KΩ
4 for R= 100 to 910 KΩ
5 for R= or > 1 MΩ

Example:
The serv.nbr. of a PR01 resistor of 47 Ω is: 4822 053 10479
The serv.nbr. of a PR03 resistor of 1 MΩ is: 4822 053 12105

NFR25 fusible resistors

Composition of the service number for the NFR25
Main subgroup: 4822 052 10...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 1 to 9,1 Ω
9 for R= 10 to 91 Ω
1 for R= 100 to 910 Ω
2 for R= 1 to 9,1 KΩ
3 for R= 10 to 91 KΩ

Example:
The service number of a resistor of 47 Ω is: 4822 052 10479

NFR25H fusible resistors

Composition of the service number for the NFR25H
Main subgroup: 4822 052 11...

The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 1 to 9,1 Ω
9 for R= 10 to 91 Ω
1 for R= 100 to 910 Ω
2 for R= 1 to 9,1 KΩ
3 for R= 10 to 91 KΩ

Example:
The service number of a resistor of 47 Ω is: 4822 052 11479

RC-01, RC-11 AND RC-21 chip resistors

Absolute max. dissipation :
RC-01 : 0,25 W, RC-11 : 0,10 W, RC-21 : 0,062 W.

Range: RC-01 0 Ω TO 10 MΩ
RC-11 0 Ω TO 10 MΩ
RC-21 0 Ω TO 6,8 MΩ

Composition of the service number for the RC-01, RC-11 and RC-21
Main subgroup: 4822 051 10... , 4822 051 20... and 4822 051 30...
The codenumber above is completed by inserting the first two figures (resistance code) followed by the multiplier.

8 for R= 0 to 9.1 Ω
9 for R= 10 to 91 Ω
1 for R= 100 to 910 Ω
2 for R= 1 to 9.1 KΩ
3 for R= 10 to 91 KΩ
4 for R= 100 to 910 KΩ
5 for R= 1 to 9.1 MΩ
6 for R= or > 10 MΩ

Example's:
The serv.nbr. for a RC-01 resistor of

0 Ω is 4822 051 10008
The serv.nbr. for a RC-11 resistor of 0 Ω is 4822 051 20008
The serv.nbr. for a RC-21 resistor of 0 Ω is 4822 051 30008

The serv.nbr. for a RC-01 resistor of 10 Ω is 4822 051 10109
The serv.nbr. for a RC-11 resistor of 10 Ω is 4822 051 20109
The serv.nbr. for a RC-21 resistor of 10 Ω is 4822 051 30109

MRS16T metal film resistors with low-inductance

Composition of the service number for the MRS16T
Main subgroup: 4822 050 1....
The codenumber above is completed by inserting the first three figures (resistance code) followed by the multiplier.

8 for R= 4,99 to 9,76 Ω
9 for R= 10 to 97,6 Ω
1 for R= 100 to 976 Ω
2 for R= 1 to 9,76 KΩ
3 for R= 10 to 97,6 KΩ
4 for R= 100 to 976 KΩ
5 for R= or > 1 MΩ

Example:
The service number of a resistor of 487 Ω is: 4822 050 14871

MRS25 metal film resistors (0,5%)

10 Ω is 4822 051 30109

MRS16T metal film resistors with low-inductance

Composition of the service number for the MRS16T
Main subgroup: 4822 050 1....
The codenumber above is completed by inserting the
first three figures (resistance code) followed by the
multiplier.

8 for R= 4,99 to 9,76 Ω
9 for R= 10 to 97,6 Ω
1 for R= 100 to 976 Ω
2 for R= 1 to 9,76 KΩ
3 for R= 10 to 97,6 KΩ
4 for R= 100 to 976 KΩ
5 for R= or > 1 MΩ

Example:
The service number of a resistor of 487 Ω is:
4822 050 14871

MRS25 metal film resistors (0,5%)

Composition of the service number for the MRS25
Main subgroup: 4822 050 2....

The codenumber above is completed by inserting the
first three figures (resistance code) followed by the
multiplier.

8 for R= 1 to 9,76 Ω
9 for R= 10 to 97,6 Ω
1 for R= 100 to 976 Ω
2 for R= 1 to 9,76 KΩ
3 for R= 10 to 97,6 KΩ
4 for R= 100 to 976 KΩ
5 for R= 1 to 9,76 MΩ
6 for R= or > 10 MΩ

Example:
The service number of a resistor of 976 Ω is:
4822 050 29761

3.6 THE MONOBOARD CENTRAL REPAIR PROCEDURE

In case of a defect on the Multi Media Controller (see Block-diagram) part, the complete panel must be sent back to PCS for repair.

Below a brief description is given, a more detailed procedure is available at P.C.S Logistics Management, systems and Procedure Office.

CODENUMBER Monoboard:

Version	Codenummer
/00	4822 214 60019
/05	4822 214 60021

- NSO or Customer: send telex or on-line MSH system info to PCS customer relations officer with indicated number(s) and service 12NC for a repair reference number.
- PCS: send telex or MSH info with repair reference number and return invoice price. Also the same number(s) of new/repared items are sent with invoice.
- NSO or customer: send defective item(s) to PCS at SDM1 by standard address label with repair reference number and return invoice to PCS -price center.
- Remark: the difference between the invoice price and return invoice price gives the 'repair price' for the NSO

- PCS: send defective item to factory and stock.
- Experience has learned that the status of the particular products and packaging needs your local attention. Products will be returned in case of unacceptable conditions.

REPAIR PROCEDURE CONDITIONS :

- * HANDLE WITH CARE IN AN ESD PROTETECTED ENVIRONMENT.
- * Defective items must be sent back to PHILIPS CONSUMER SERVICE for repair forwarded by Address sticker.
- * Put the address sticker properly on a free area of the box.
- * Boards must not be reworked or damaged.
- * Re-use original package order new package in case of damages.
- * Remove additional stickers and labeling if re-using the original box. Service codenummer on sticker must be equal to codenummer on repairable item.

!!! If the above conditions are not fulfilled, then boards are not accepted and the return price will not be credited !!!

- Dealers have to contact the local PHILIPS sales-organization.

4.2 EXPLODED VIEW OF THE CABINET

4.3 EXPLODED VIEW OF LOADER

5 SERVICE SOFTWARE

In the set there are 3 different testsoftware available:

1. FTD-display/keyboard test
2. Low Level test
3. Service Shell

5.1 THE FTD-DISPLAY/KEYBOARD TEST

Scope (not for CDI200 and CDI210).

This testfeature includes following tests:

- FTD filament test
 - Player keyboard test
 - NVDS signal test
- (The NVDS signal is to switch on/off to the FMV mode)

5.1.1 Test sequence

- To startup this test press the 'PAUSE' button on the front of the player while switching on the power. After approximately 5 seconds a '0' will appear on the FTD. Now the test software is activated.
 - First test, the keyboard test. Now all front keys should be pressed one by one in a proper sequence. Every time the correct key is pressed, the counter on the FTD will increment by one.
- The correct sequence is :

1. EJECT
2. PREVIOUS TRACK
3. PLAY
4. NEXT TRACK
5. PAUSE
6. STOP

After this, if any key is pressed then the FTD test will startup. In this test also the remote control player-control-keys can be used.

- **Second test**, the FTD/NVDS test. By using any key (remote or on the front of the player) except the 'PLAY' will toggle all FTD filaments on and off. Simultaneously the NVDS signal, which is an internal signal will be toggled. This can be noticed by looking to the TV or monitor screen, the picture on the screen will dissappear at the toggling of NVDS.
- **To continue and go to the normal mode just press 'PLAY'.**
Now the player shell will be started and the player can be operated normally again.

5.2 THE LOW LEVEL MMC TEST

Scope

This test is standard implemented in the boot software of CD-RTOS. It doesn't need a lot of hardware to run. When debugging or servicing an MMC panel this test is very useful. The Low Level test in Menu driven.

General

This test is developed for service and low level hardware debugging purposes only. It is meant to be used with the service pcb as described in TOOLS (please refer to section 3.5 SERVICE TOOLS). The test executed with the service pcb is called the "**pcb low level test**".

The test executed with the VT100 terminal is called the "**terminal low level test**". Since this service pcb display has just 8 digits, only the most important information will be displayed to the user. For the VT100 terminal this is never a problem. This test consists out of the following items:

- Display header and release number.
- VSC init
- ROM
- NVRAM
- DRAM
- CDIC
- SLAVE processor (68HC05)
- Clock Calibration (only for Terminal Low Level test)
- ATTEX (only for Terminal Low Level test)
- X-bus

5.2.1 Tools

In this test the service pcb acts as some kind of a 'micro terminal'. This means that the service pcb is able to display some alphabetical and numerical characters. Some characters because it uses 7-segment displays

The three keys available are :

- TEST ; test all display leds.
- Yes ; Send an ASCII 'Y'.
- No ; Send an ASCII 'N'.

The communication parameters are fixed at :

- 9600 baud
- 8 data bits
- 1 stopbit
- no parity

The microcontroller is programmed with software available at IMS CDI software group.

The circuit diagram is on section 3.5.1.1

5.2.2 Testsquence

Table 1 below shows all the steps of the testprogram and what kind of tests are performed.

Table below shows all the steps of the testprogram and what kind of tests are performed.

STEP	ACTION/TEST PERFORMED
0	Exit Low Level test
1	Writing to a default RAM address
2	ROM parity check
3	NVRAM test
4	DRAM test
5	CDIC test
6	Slave processor test
7	Clock Calibration
8	ATTEX test
9	X-bus test

5.2.3 Low level test implementation

The low level test (short: lltest) is implemented in the boot part of the CD-RTOS software. The whole test occupies about 15k of ROM memory and is written in assembler. The test runs without the use of any external RAM. It only uses internal CPU registers. As communication channel the 68070's UART is used. Before starting the normal player boot the following sequence is executed :

1. Initialize the 68070's UART : 9600 baud
1 startbit
8 databits
1 stopbit
no parity
no handshake !
2. Clear the RXD buffer.
3. Wait 5 ms.
4. Read the RXD buffer.
If the character received was a space (\$20) the start the terminal lltest.
If the character received was an ACK (\$06) the start the pcb lltest.
5. Else start the normal player boot.

The UART is connected to I/O port 2

5.2.4 How to start up the low level test

With service pcb

To startup **the pcb low level testsoftware** the next sequence should be followed:

- Switch off the player.
- Connect service pcb to port 2 at the rear of the player.
- Switch on the player.
- The service pcb display should now show 'CDI RLxx'.
(with xx the release number)
- The pcb lltest is now ready to go.

With VT100 terminal

To startup **the terminal low level testsoftware** one should follow the next sequence:

- Switch off the player.
- Connect the terminal to the 68070's UART of the player.
- Switch on the player while pressing the SPACE-bar of the terminal.
- The terminal should now show the title of the terminal lltest.

5.2.5 PCB low level test

If the service pcb is connected to port 2 the pcb low level test is executed after power on. In table 1 a survey is given for all tests executed.

Display lltest release number:

When this lltest is entered, first the release number of the pcb lltest will be displayed.

Example :

CDI RLxx

(RL stands for RELEASE, xx stands for release x.x).

The lltest is now waiting for an action from the user. The user should now press either the 'Y' or 'N' button to continue the test.

STEP 0 : VDSC

STEP 0A0B : VDSC channel 1&2 registers

display: 0A0B

In this step some registers of the VDSC Channel 1&2 are initialized.

STEP 1 : ROM

In this step the contents of the ROM is checked. Following tests are done on the ROM :

1. Display ID byte and release number of this ROM.
(test A)
format 'IDxxRLyy'
3. Check if the parity of the ROM is OK.
(test C)

STEP 1 : ROM

STEP 1A : ID AND RELEASE NUMBER DISPLAY

display: 1A IDxxRLyy

In this step the release number of this ROM is displayed for a moment.
(ID stands for IDentification, xx is the id number.
RL stands for RELEASE, yy stands for y.y)

STEP 1C : CHECKSUM

display: 1C

In this step the checksum of this ROM is calculated as described in "how is the checksum calculated ". If the checksum is not ok an error will be displayed.

display: 1C Er05

STEP 5 : NVRAM

The nvram test is a non destructive test. This means that the original nvram contents is restored again.
Address range : Full nvram address range

display: 5

The following actions take place in the nvram test:

1. read byte from nvram and save it in a register
2. write a pattern (from ROM) to nvram
3. read byte from nvram and compare with pattern
4. if byte read is ok then continue with action 5 else give error message and stop testing

If error,

display: 5 Er09

5. write inverted pattern to nvram
6. read byte from nvram and compare with pattern
7. if byte read is ok then restore original byte
else give error message and stop testing

If error,

display: 5 Er10

8. repeat this for every possible nvram address.

STEP 6-8 : DRAM

The dram test is always a destructive test. The test is performed for both ram chip1 and chip2 as one large memory followed by a test for each bank separately. On the displays following, the 'x' is a memory counter. The counter is incremented every 256k. So for the full range it counts from 1 to 4.

STEP 6A : TEST THE FULL DRAM MEMORY

The following actions take place in this test:

1. fill the memory with the long word address as data.

display: 6AFx

2. read the memory contents and compare with the address.

display: 6ARx

3. if the long word read is ok then continue
else give error message and stop testing.

If error,

display: 6ArxEr11

STEP 6B : TEST THE FULL DRAM MEMORY WITH INVERTED DATA

The following actions take place in this test:

1. fill the memory with the inverted long word address as data.

display: 6BFx

2. read the memory contents and compare with the inverted address.

display: 6BRx

3. if the long word read is ok then continue
else give error message and stop testing.

If error,

display: 6BrxEr12

STEP 7A : TEST DRAM CHIP1

The following actions take place in this test:

1. fill the memory with the long word address as data.

display: 7AFx

2. read the memory contents and compare with the address.

display: 7ARx

3. if the long word read is ok then continue
else give error message and stop testing.

If error,

display: 7ARxEr13

STEP 7B : TEST DRAM CHIP1 WITH INVERTED DATA

The following actions take place in this test:

1. fill the memory with the inverted long word address as data.

display: 7BFx

2. read the memory contents and compare with the inverted address.

display: 7BRx

3. if the long word read is ok then continue
else give error message and stop testing.

If error,

display: 7BRxEr14

STEP 8A : TEST DRAM CHIP2

The following actions take place in this test:

1. fill the memory with the long word address as data.

display: 8AFx

2. read the memory contents and compare with the address.

display: 8ARx

3. if the long word read is ok then continue
else give error message and stop testing.

If error,

display: 8ARxEr15

STEP 8B : TEST DRAM CHIP2 WITH INVERTED DATA

The following actions take place in this test:

1. fill the memory with the inverted long word address as data.

display: 8BFx

2. read the memory contents and compare with the inverted address.

display: 8BRx

3. if the long word read is ok then continue else give error message and stop testing.

If error,
display: 8BRxEr16

STEP 9 : CDIC

This test only checks part of the CDIC ram, mainly because it is possible that during the test the CDIC destroys part of the ram contents.

address range : CDIC base address + \$1400 to CDIC base address + \$3C7F.

cdic register2 : CDIC base address + \$3FFA register2 contents after reset: \$C7FE

STEP 9A : CDIC RAM TEST WITH ADDRESS AS DATA

display: 9A

The following actions take place in the CDIC RAM test:

1. Fill the memory with long word address as data.
2. Read and compare the data with the address.
3. If the long word read is ok then continue else give an error and stop testing.

If error,
display: 9A Er17

STEP 9B : CDIC RAM TEST WITH INVERTED ADDRESS AS DATA

display: 9B

The following actions take place in the CDIC RAM test:

1. Fill the memory with inverted long word address as data.
2. Read and compare the data with the inverted address.
3. If the long word read is ok then continue else give an error and stop testing.

If error,
display: 9A Er18

STEP 9C : CDIC REGISTER 2 TEST

display: 9C

The following actions take place in the CDIC REGISTER test:

1. Read register 2 and compare with fixed pattern.
Register 2 has a defined pattern after reset.
2. If the register is ok then continue with next step else give an error and stop testing.

If error,
display: 9C Er19

STEP 10 SLAVE processor (68HC05)

This test checks the communication with the slave processor.

Additionally it displays the slave and cd processor release numbers. If the communication with the cd processor via SPI does not function, the cd release number will give a 0.0.

Address range : Slave base address + 6

STEP 10A : WRITE REQUEST BYTE TO THE SLAVE

display: 10A

In this step a \$F0 (request) is written to the slave.

STEP 10B : READ ACKNOWLEDGE FROM THE SLAVE

display: 10B

In this step the following actions take place:

1. wait about 2 sec to give the slave the time to acknowledge.
2. read the acknowledge.
3. if the acknowledge is \$F0 then continue else give an error and stop testing.

if error,
display: 10B Er20

STEP 10C : READ AND DISPLAY SLAVE RELEASE NUMBER

display: 10C RLxx

For a moment the slave release number is displayed

STEP 10D : READ AND DISPLAY CD RELEASE NUMBER

display: 10D RLxx

Wait until a key is pressed.
Read the next byte: this is a dummy read.

STEP 11 : X-BUS TEST

This test checks the Xbus communication from DSP to servo processor. First it writes a transparent command into the CDIC memory. The servo processor receives it by the X bus and returns the command via the SPI bus to the slave processor. The given command is then returned by the slave to the testsoftware.

STEP 11A : XBUS TRANSPARENT COMMAND TO CIDIC

display : 11A

In this step a transparent Xbus test command is written to CIDIC. CIDIC will transfer this command to the servo processor via the Xbus.

STEP 11B : READ ACKNOWLEDGE FROM THE SLAVE

display : 11B

In this step the following actions take place :

1. Wait about 2 sec to give the slave the time to acknowledge.
2. If the acknowledge is \$A4 \$7A \$3B \$1C then continue
else give an error and stop testing.

If error,
display : 11b Er21

STEP DESCRIPTION

0a	VDSC channel 1 initialization
0b	VDSC channel 2 initialization
1a	ROM identification release number
1c	ROM checksum check
5	NVRAM test with rom data as data
6af	DRAM fill chip1&chip2 with address as data
6ar	DRAM read and compare data
6bf	DRAM fill chip1&chip2 with inverted add. as data
6br	DRAM read and compare data
7af	DRAM fill chip1 with address as data
7ar	DRAM read and compare
7bf	DRAM fill chip1 with inverted address as data
7br	DRAM read and compare data
8af	DRAM fill chip2 with address as data
8ar	DRAM read and compare
8bf	DRAM fill chip2 with inverted address as data
8br	DRAM read and compare data
9a	CDIC RAM test with address as data
9b	CDIC RAM test with inverted address as data
9c	CDIC register test
10a	SLAVE test :write request to slave
10b	SLAVE test :read echo from slave
10c	SLAVE test :read SLAVE release number from slave
10d	SLAVE test :read CD release number from slave
11a	Xbus test write command to CIDIC
11b	Xbus test read response from servo in Slave μ P

Table 1 : PCB LLTEST steps overview

5.2.6 TERMINAL LOW LEVEL TEST

If a VT100 or compatible terminal is connected to the 68070's UART of the CDI player one is able to execute the terminal low level test. Due to the fact that almost every test is self explanatory only the major steps are described below. In this test it is possible to skip every major step.

Display lltest header and release number

In this step the VDSC is initialized in the same way as in the pcb lltest.

ITEM 0 : EXIT LOW LEVEL TEST

Selecting this item will end the lltest and continue with the boot. After the boot the player shell is started up.

ITEM 1 : Writing to a default RAM address

This test writes the powers of 2 to a (word) address. The result is read again and will be displayed. The address can be selected by the user (only word addresses). Pressing 'ESC' stops the test.

If one tries to write to unused space in the memory map, the program will NOT generate an error message and the system will hang up.

ITEM 2 : ROM parity check

For the ROM the following information is displayed and checked:

- Display the identification code for this ROM (ROM ID)
- Display the release number of this ROM
- Display the checksum of this ROM. The upper word of the checksum displayed is always '0000'. If the checksum is not ok then a specific error will be displayed. This error is the same as in the pcb low level test.

ITEM 3 : NVRAM test

For the NVRAM test three different tests can be selected:

- The first is a non destructive nvram test as in the pcb low level test.
 - The second test is a destructive nvram test with ROM data as test data.
 - The third test is also a destructive test with the address as data.
 - The third test has also some hidden functions. Pressing :
 - w : writes continu the address as data to the nvram.
 - r : reads continu the complete nvram (no display).
 - d : displays the contents of 421 succeeding ram locations. The start address is given by the user.
- ESC stops these functions.

Remark : The error message is different from the pcb lltest.

See error table for more information.

ITEM 4 : DRAM

The dram test is always a destructive test. The test is performed for both ram CHIP1 and CHIP2 as one large memory followed by a test for each bank separately.

The following actions take place in the dram test:

1. fill the memory with the long word address as data.
2. read the memory contents and compare with the address.
3. if the long word read is ok then continue else give error message and stop testing.
4. write the inverted long word address as data to memory.
5. read the memory contents and compare with the inverted address.
6. if the long word read is ok then continue else give error message and stop testing.

This test has also some hidden functions. Pressing :

- w : writes continu the long address as data to the dram.
r : reads continu the dram (no display).
d : displays the contents of 421 succeeding ram locations. The start address is given by the user.
ESC stops these functions.

Remark : The error message is different from the pcb ltest.
See error table for more information.

ITEM 5 : CDIC

The cdic test consists out of three main parts:

1. test cdic ram with long word address as pattern
2. test cdic ram with inverted long word address as pattern
3. display cdic register and compare If in one of these tests an error occurs the test will be stopped and the error displayed.

ITEM 6 : SLAVE processor (68HC05)

This ltest for the slave performs following actions:

1. Write \$F0 to the slave processor.
2. Read byte from same address, the slave should respond with \$F0.
3. If data is not \$F0 then stop testing and display error code else continue with next action.
4. Read the next byte: this byte is the release number of the slave processor firmware.
Display the release number. If the release number is \$00 then an error will be displayed.
5. Read the next byte: this byte is the release number of the CD processor firmware. Display the release number. If the release number is \$00 then an error will be displayed.
6. Read the next byte: this is a dummy read.

ITEM 7 : CLOCK CALIBRATION

This step is not really a test. It is a software tool that can be used to trim the clock&calendar chip so that it runs within 1 minute acc. per month. If calibration is not needed, this step should be executed since a frequency counter is needed to complete this test successfully. If this test is entered accidentally, just switch off the power and restart the ltest. The clock calibration should be performed with an external frequency counter.

- Connect the probe of the counter to pin34 of IC7304 (CSCD1CN).
- Start the test with the gate time of the frequency counter set to minimum 5 sec.
- The counter display should now show a frequency near to 512 Hz.
If not, the chek if everything is set and connected properly. (range : 511,96724 to 512,03276)
- Press a key on the terminal to stop the measurement.
- Now fill in the measured value of the frequency. The ltest software will now calculate the proper value to be filled into the calibration register of the clock&calendar IC. The value of the frequency at pin34 of IC7304 will not be changed or influenced.
- The calibration is done now.

ITEM 8 : ATTEX test

This step is only intended to be used with an oscilloscope. The software will generate a pattern on some ATTEX pins. These pins and their signals are described below. It is not guaranteed that this test always runs. If one of the devices connected to the ATTEX is defective (no DTACK) it will surely result in a hang-up of the testsoftware.

Within this test the following selections can be made:

0. Exit ATTEX menu
Exit the menu for ATTEX test and go back to main menu.
1. Generate full range VDSC-cs
Generate Chip Selects in the Complete VDSC address range.
Address range : \$000000 - \$47FFFF
2. Generate full range CIDIC-cs
Generate Chip Selects in the Complete CIDIC address range.
Range : CIDIC base address - (CIDIC base address + \$FFFF)
3. Generate full range Slave-cs
Generate Chip Selects in the Complete slave processor address range.
Range : Slave base address - (Slave base address + \$7777).
4. Generate full range NVRAM-cs
Generate Chip Selects in the complete NVRAM address range.
Range : NVRAM base address - (NVRAM base address + \$1FFFF)

5. Generate KillME and DMAEN (toggle)
Generate a toggle function for the KILLME and DMAEN signals in their complete address range.
Range : base address - (base address+\$7FFF)

ITEM 9 : X-BUS test

This tests the X-bus between DSP and servo processor. It assumes that the SPI communication channel between slave processor and servois working correctly. First it writes a X-bus test command into the CIDIC command register (transparent mode). The DSP will send this command via the X-bus to the servo processor. The servo processor recognizes this X-bus test command and sends it back via the SPI bus to the slave processor. If the X-bus test command is received by the slave processor correctly then the test was successful, if not then something could be wrong with the X-bus in such a case an error is displayed.

5.2.7 ERROR CODES

When during a test an error occurs the user should be aware of following conventions:

- For the pcb low level test the error is displayed on the outermost righthand side of the display.

Example: 1 Er11

An survey for all error codes is given in table 2.

- For the terminal low level test the error is displayed on the outermost lefthand side of the terminal. In some cases (memory tests) the error code is replaced by a more meaningful error output.

Example: ADDRESS DATA READ EXPECTED

ERROR : 00080000 F0080000 00080000
RETURN to continue, ESC to STOP

Meaning: (assuming long word data is used);
On address \$80000 the data was \$F0080000 and not \$80000 as it should be.

- If RETURN button is pressed, the next address will be read and checked. With this output it will be easier to debug the MONOboard
- When an error has occurred the program will wait for a user intervention with following question:
RESTART the test Yes or No ?
If the answer was 'Y' then the ltest software is executed again from the beginning.
If the answer was 'N' then the next test is executed as if nothing happened.

ERROR	DESCRIPTION	DISPLAY
05	ROM checksum error	Er05
09	NVRAM error	Er09
10	NVRAM error (for inverted data)	Er10
11	DRAM error (bank0 & bank1)	Er11
12	DRAM error (bank0 & bank1, inverted data)	Er12
13	DRAM bank0 error	Er13
14	DRAM bank0 error (inverted data)	Er14
15	DRAM bank1 error	Er15
16	DRAM bank1 error (inverted data)	Er16
17	CDIC RAM error	Er17
18	CDIC RAM error (inverted data)	Er18
19	CDIC register error	Er19
20	SLAVE error (wrong echo from slave)	Er20
21	Xbus transfer error	Er21

Table 2. Error codes overview

5.2.8 RELEASE NUMBER, ID AND CHECKSUM STORAGE

The release number, ID and checksum are always stored in the CDI ROM. Step 1 of the pcb ltest as well as the terminal ltest uses all this information to check if the ROM is ok.

Where are these bytes stored in the ROM's, where in the memory?

ROM address range for the 4Mb :
\$00000-\$7FFFF

MONO address range for the 1Mb :
\$400000-\$47FFFF

ROM address \$7FFFF = LSByte of the checksum
\$7FFFE = MSByte of the checksum
\$7FFFD = Release number of this ROM (BCD coded)
\$7FFFC = Player ID (BCDcoded)

MONO address \$47FFFF = LSByte of the checksum of the ROM
\$47FFFE = MSByte of the checksum of the ROM
\$47FFFD = Release number of the ROM (BCD coded)
\$47FFFC = Player ID (BCDcoded)

5.2.9 HOW IS THE CHECKSUM CALCULATED ?

The checksum is calculated for every ROM separately. The checksum is the algebraic sum of all bytes in that ROM except the 2 bytes where the checksum is written. Only the LSWord of the sum is used. To calculate the real checksum of the ROM just add these 2 bytes to the LSWord of the sum.

The last 1024 bytes are always assumed to be all \$FF.

ROM checksum =
sum of all bytes of the address range \$40000 to \$47FFFD
ROM checksum displayed in STEP 1 =
ROM checksum + (LSB + MSB) of this checksum.
This is also equal to the checksum of the complete ROM.

5.3 THE SERVICE SHELL

Introduction.

For service purposes the CD-I set has built-in software modules. These modules can be activated via the service shell by menu.

The modules are for the testing of :

- Video circuitry, by means of a colorbar testpattern
- CDM and servo circuitry
- Input / Output ports
- Audio circuitry

Testing the CDM, servo and audio circuitry in the service shell is only possible with a CD-DA disc.

5.3.1 Starting the service shell

The service shell can be started by connecting the RXD and TXD lines of port 1 (pin2 and pin3) during start up (insert testplug before power on or reset).

5.3.2 Layout info

selectable/non selectable items

Each menu of the service shell consist of a number of boxes and text strings. Some of these boxes can be selected by moving the screen cursor above the box and clicking on one of the joystick buttons. Only the colored boxes can be selected. Clicking on one of the other boxes will have no effect.

(error) messages on the screen

The service shell will provide information and errors in a box at the top of the screen. To remove such a message and continue with the test a button must be clicked on the remote control joystick.

menu structure

When the service shell is started, the main menu appears with a number of boxes on it. Selecting some boxes will result in a submenu being displayed, other boxes may result in immediate action. Selecting the EXIT box will stop the service shell and restart the player. Selecting EXIT in a submenu will return you to the previous menu.

5.3.3 Subject dependent information

Main menu

The main menu contains four test item boxes and the EXIT box. Selecting TEST IMAGE will give immediate action, the other three test items will display a submenu.

CD test

This menu has two information boxes at the top of the screen. Below it are three test items for the CD player and below these are three buttons that can be selected only during the CD drive test. When the menu is first entered, only the three test item boxes can be selected. Subjects of the CD test are the cd drive itself, the X bus and a test on Digital Out.

When this menu is selected in the main menu, the communication channel with the CD processor will be checked first. A message will be displayed giving the result of this check (either O.K. or No response). After pressing one of the buttons (to remove the message) the cd menu will be displayed.

Fig 3.2 CD test menu

The X bus test will result in immediate action. It checks the communication channel between the CDIC and CD processor that is normally used to send commands (seek, read etc) to the CD processor. The result is either O.K or No response.

The Dig. Out test will also give immediate action. Its purpose is to check whether the CDIC receives a Digital Out signal or not. The result of this test is O.K. or No Digital Out. The CD drive test uses a different menu and will therefore be described in a separate paragraph.

CD drive test

The CD drive test will perform the service loop as implemented in the Philips CD audio players. A disc is needed for this test. Results of this test will be displayed on the screen instead of a display. When the cd drive test is selected, the same screen will appear, but with other buttons highlighted. You cannot select the X bus and Dig Out test anymore. Selecting the EXIT button will return you to the cd menu. (X bus and Dig Out button highlighted again). The drive test consist of the following steps:

Mode 0

Software release number of the CD micro processor is displayed in the button at the left top of the screen (cd status button). Mode 0 is displayed in the button at the right top of the screen (mode button). During the cd drive test this button will display the current mode.

In mode 0, the ARM IN and ARM OUT buttons can be selected to move the cd lense inwards and outwards. Selecting NEXT STEP will bring the player in mode 1.

Mode 1

In mode 1 the cd driveprocessor will try to focus. If it manages to do so (a disc must be present!), the message IN FOCUS will appear in the status button. Otherwise, the message NO FOCUS will appear in the status button after the cd driveprocessor has tried to focus 16 times (this may take a while). In that case (no focus found) the test will return to mode 0.

Selecting NEXT STEP will bring the player in mode 2.

Mode 2

The turntable motor is rotating and controlled by the rough HF, moving the cd lense outside (by hand) will slow the disc down.

If an error occurs, the test will return to mode 0.

Selecting NEXT STEP in mode 2 will bring the player in mode 3.

Mode 3

You can select ARM IN and ARM OUT to make the cd lense jump inside or outside (small jumps). The laser will keep jumping while a button is pressed on the remote control.

If an error occurs, the test will return to mode 0. NEXT STEP in mode 3 will bring the player in normal playing mode.

Normal playing mode

The player shell will be started and errors sent by the cd processor will be displayed in a box on the screen. You cannot return to the service shell otherwise than by resetting the player.

ERROR MESSAGES

display : A5 xx0000

- xx = 2 : focus error
- xx = 3 : radial error
- xx = 5 : off error (TL stays low for 50 msec.)
- xx = 6 : jump error
- xx = 7 : subcode error, no valid subcode in 3 sec.
- xx = 8 : TOC error : out of lead-in area while reading the TOC
- xx = 30 : to many grooves to jump
- xx = 31 : search time out
- xx = 32 : bin. search error
- xx = 33 : search index error
- xx = 34 : search time error
- xx = 37 : selection error

Duart test

This test is not relevant for the consumer players

APU/key test

This is a combined menu, the attenuation can be changed via this menu and the keys on remote control and player can be tested with it. There are three buttons for every attenuation path on the screen. Two of them can be selected (to increment/decrement) and one is used to display the current attenuation value for the path. There is also a MONO/STEREO button on the screen. In STEREO, two attenuation paths are disabled (left to right and right to left), in MONO all attenuation paths are enabled. Maximum attenuation is reached at the value 47 (no sound). A CD audio disc is needed for the attenuation test. The test routine will start playing the disc at initialization.

When a key is pressed, a text will appear on the key button on the right side of the screen describing the button pressed. The text will disappear when the key is released.

Fig 3.4 APU test menu

Video test image

A colorbar will be displayed on the screen. Pressing a button after the screen has been filled completely will return you to the main menu. There are no error messages for this test.

What could be wrong if...

This paragraph will describe the meaning of the error messages given by the service shell and contains suggestions about possible errors. This paragraph must be updated with new information from testing and debugging players.

Service shell cannot be started with the testplug. Connections between port 1 and slave may be bad. Testplug could be wrong. Maybe the slave processor is defect. If the player-shell cannot be started either, try the low level test first.

The key test will display the text ERROR if an unknown key code is received.

CVBS	: CVBS output	HEADPHR	: (HPR) headphone audio right
CVBS-OUT	: >>	HFIN	: HF current input
CVBS-REM	: CVBS input signal for the remodulator	HSYN	: (active low) horizontal synchronisation input from the VSC
CVBS-SYNC	: composite sync input for the SCART connector	HSYNCOUT	: (active low) horizontal synchronisation output for monitor or TV
D0..7	: input data bus for the two DAC'S of the APU part	HVID0..7S	: 8 bit pixel bus for channel 1 VSD from VSC
DAAB	: (DAAB2, DAABCD) serial data output of the X-bus I ² S standard	IACKN	: interrupt acknowledge for the FMV-extension
DATA0..15	: DATA LINES	IACKIN2N	: >>
DATADAC	: data which will be send to the DAC('S) for volume adjustment	IACKIN4N	: >> decoded interrupt acknowledge (active low).
DDTACKN	: DATA TRANSFER ACKNOWLEDGE (active low) from CDIC	IACKIN5N	: >> asserted during an interrupt acknowledge
DEEMP	: DEEMPHASIS	IACKOUT2N	: >> sequence to indicate to a peripheral that
DIG OUT	: DIGITAL OUTPUT	IACKOUT4N	: >> this interrupt request is being serviced
DIRN	: DIRECTION CONTROL. indecates the direction of data transfer through the transievers	IACKOUT5N	: >>
DISCLK	: (DISCLKE) DISPLAY CLOCK >>	IACKOUT2	: >>
DISDAT	: (DISDATAE) DISPLAY DATA >>	IACKOUT4	: >>
DISEN	: (DISENE) DISPLAY ENABLE >>	IACKOUT5	: >>

IACKOUT22 : >>
 IACKOUT23 : >>
 IACKOUT42 : >>
 IACKOUT52 : >>
 IDAC : 1/2 bit DAC
 IFDN2 : main channel word-flag to the DSP
 INTENN1 : interrupt enable for the FMV-extension
 INTENN : >> when low, no extensions use the
 interrupts, when high interrupt devices
 are daisy chained

 INTENN2 : >>
 INTENN3 : >>
 INTENN4 : >>
 INTREQN : interrupt request from the
 FMV-extension

 IN2IN : (= IN2OUT) >>
 IN4IN : (= IN4OUT) >> decoder interrupt
 priority inputs
 IN5IN : (= IN5OUT) >> (active low) IN2IN has
 the lower
 IN2OUT : >> and IN5IN has the higher priority
 IN4OUT : >> IN2IN = SLAVEPROCESSOR
 (6805), IN4IN =
 IN5OUT : >> CDIC (IMS66490), IN5IN = DUART
 IN4OUT2 : >>
 IN5OUT2 : >>
 IN2OUT3 : >>
 KILL : to mute audio outputs by power on and
 off
 KILLME : (KILL-ME) dot killer enable signal
 (active for NTSC)
 LA1 : >> control signals for brushless
 DC-motor
 LB1 : >>
 LC1 : >>
 LADD1..23 : ADDRESS-BUS (active high, tristate)
 for direct addressing of 16 Mbyte of
 memory
 LBOT : for HPL volume control
 LDSN : LOWER DATA STROBE of the bus
 LM : LASER MONITOR diode input
 LO : laser amplifier current OUTPUT
 LRDN : when low select, the ROM'S or NVRAM
 read the lower data byte
 LTAP : >> for HPL volume control
 LTOP : >>
 LVID0IN..7IN : >> 8 bit pixel-bus for channel 2
 (VSC-SLAVE)
 LVID0OUT..7OUT : >>
 LWN : read/write enable (for the lower part of
 the data: MD0..7) for the DRAM (VDSC)
 LWRSN : R/W lower memory data to DRAM from
 VSC slave
 LWRMN : R/W lower memory data to DRAM from
 VSC master
 MC : MOTOR CONTROL signal
 MISO : MASTER IN SLAVE OUT
 MOSI : MASTER OUT SLAVE IN
 MPEGL : left audio signal color coming from the
 FMV-extension > goes the adder
 CDI/FMV audio
 MPEGR : right audio signal color coming from the
 FMV-extension > goes the adder
 CDI/FMV AUDIO
 MSM : master slave selection input

MSMA0..8 : ADDRESS-BUS between the DRAM'S
 of the VSC' MASTER and the VSC
 MASTER
 MSMD0..15 : DATA-BUS between the DRAM'S of
 the VSC' MASTER and the VSC
 MASTER
 NCSYNV : composite sync for the VDSC
 NHSYN : active low horizontal sync input for the
 FMV-extension
 NRESET : when low the video synthesizer is in
 reset
 NVDS : digital output to control an external
 switch for TV overlays (active low)
 NVDSI : >> synchronized with NXT2
 NVSYN : (active low) vertical sync input for the
 FMV-extension
 PCLK1IN : PIXEL CLOCK for channel 1
 PCLK2IN : PIXEL CLOCK for channel 2
 PLOIN1 : input clock for CDIC (22,5792 MHz)
 PLOIN2 : input clock for CDIC (19,3536 MHz)
 PLOIN : clock signals for emulator panel
 PLOINE : >>
 POTBL : headphone left volume control
 POTBR : headphone right volume control
 POTML : headphone left volume control
 POTMR : headphone right volume control
 QCL : Q-channel CLOCK
 QDA : Q-channel DATA
 QRA : Q-channel REQUEST
 INPUT/ACKNOWLEDGE OUTPUT
 Q22 : output to PLL (22,5792 MHz) divided
 by 14
 Q21 : output to PLL (19,3536 MHz) divided
 by 12
 RAD+ : >> RADIAL OUT to CDM
 RAD- : >>
 RBOT : for HPR volume control
 RC5 : wired RC input (cinch)
 RCEYE : (RCEYEE) REMOTE CONTROL EYE
 RCLED : REMOTE CONTROL LED
 RDN : READY signal, starting up procedure
 finished
 RDYN : READY (active low) of the DMA channel
 REDIG : RADIAL ERROR DIGITAL
 REM : power supply remodulator
 RESETCD : when low resetsequence starts
 RESETINN : when low VSC is in reset
 RESETN : this is the reset for all other ic's on MMC
 RESETSYS : system reset (controlled by the
 slave-processor)
 REQ2N : DMA-request of channel 2
 REQ2NKON : DMA-request (96-pins connector,
 channel 2 : FMV
 REQ2KON : DMA-request of channel 2 via DMA 2
 on/off circuit
 RFMV : red color coming from the
 FMV-extension
 RIN : red color input for the CXA1145 encoder
 RSC : red color (scart)
 RSTOUT : RESET OUT of the slave processor
 when high resetsequence starts
 RTAP : >> for HPR volume control
 RTOP : >>
 RTSE1..2 : REQUEST TO SEND
 RTSI1..2 : REQUEST TO SEND

RTSUART	: REQUEST TO SEND from the slave processor to the UART of the 68070 processor	TXDE1..2	: transmit data
RST1..4	: >> REQUEST TO SEND (active low)	TXDI1..2	: transmit data
RST#1..2	: >>	TXD1..4	: >> TRANSMIT DATA TXD is data output
RWN	: READ - WRITE (low is write) signal	TXD#1..2	: >>
RWN2	: READ - WRITE (low is write) signal from CDIC to the DSP	UDSN	: UPPER DATA STROBE (active when low)
RWRAM	: READ - WRITE signal from the CDIC to the S RAM'S	URDN	: READ UPPER DATA BYTE (active when low)
RXDE1..2	: RECIEVE DATA	UWN	: read/write enable (for the upper part of the data: MD8..15) fir the DRAM (VDSC)
RXDI1..2	: RECIEVE DATA	UWRSN	: read/write (write when low) UPPER MEMORY DATA FROM DRAM'S FROM VSC-SLAVE
R0..7	: digital video (red) from VDSC > DRAM	VC	: output DC-motor (VOLTAGE CONTROL)
RXD1..4	: >> RECIEVE DATA RXD is data input	VDSC-INTN	: interrupt request of the VDSC
XD#1..2	: >>	V-FLAG	: output to the DSP
SCAB	: subcode data clock (2,8224 MHz) from the 7310	VSCM-INTN	: when low, interrupt from VSC master to 68070 processor
SDAB	: subcode data from the 7310	VSCS-INTN	: when low, interrupt from VSC slave to 68070 processor
SI	: on - off control for laser supply and focus circuit	VSYN	: (active when low) VERTICAL SYNCHRO-NISATION INPUT from the VSC
SI-RD	: on - off control for laser supply and focus circuit/ready signal, starting up procedure finished	WIREDRC	: see RC5
SLMA0..8	: VSC-slave memory address bus to the DRAM'S	WRMN	: read/write (write when low) UPPER MEMORY DATA FROM DRAM'S FROM VSC-MASTER
SLMD0..15	: VSC-slave memory data bus to the DRAM'S	WRN	: WRITE UPPER DATA BYTE (active when low)
SOXENN	: Serial output enable for the XBUS (enabled when low)	WRPN1M..S	: control input for channel 1 or 2 (active low) of the VSD
SOXRQN	: SERIAL OUTPUT REQUEST FOR THE X-BUS (when low)	WSAB	: >> WORD SELECT from A to B CHIP
SOYENN2	: SERIAL OUTPUT ENABLE FOR THE Y-BUS (when low)	WSAB2	: >>
SPICK	: SERIAL PERIPHERAL INTERFACE CLOCK	WSABCD	: 11.2896 MHz bitclock (I ² S)
SPISS	: (SPISSN) SERIAL PERIPHERAL INTERFACE SLAVE SELECT	XINB	: delayed clock XIN from CDIC > goes back to CDIC
STAND	: NTSC or PAL selection signal	XIN	: >> 11,2896/9,6768/4,8384 symmetrical clock
STANDARDOUT	: software choise between PAL and NTSC	XIN2	: >>
STANDARDSW	: hardware choise between PAL and NTSC	X-TAL2	: the same as the system clock, coming out of the VSC'S
STANDEM	: status from emulator, input for DUART	XT2	: (XT2N) the system clock devided by two
STANDEMEN	: enable signal for switch signal on emulator	XT4	: >> the system clock devided by four
STATUS	: RF/external video selection signal	XT41N	: >>
STATUSF	: CVBS/RGB video selection signal	0AD..12AD	: >> ADDRESS BUS, between CDIC-SRAM'S and SYSTEM ADDRESS BUS BUFFERS
SSM	: START STOP MOTOR	10ADA..12ADA	: >>
SWAB	: SUBCODING WORD CLOCK INPUT	0D..15D	: DATA BUS between CDIC and DSP
SWAB-SSM	: subcoding word clock output and start/stop input of the 7310	0DA..15DA	: DATA BUS between CDIC-SRAM'S and SYSTEM DATA BUS TRANCIEVERS
SWEM	: software dat to switch on the emulator	2BCLK	: CLOCK for the 2 B-chip
SYSCLK	: >>SYSTEM CLOCK	12A..15A	: ADDRESS BUS between CDIC and DSP
SYSCLKA	: >>		
SYSCLK1	: >>		
SYSCLK2	: >>		
TCAP	: input capture feature for the on-chip timer		
TCMP	: output for the output compare feature of the on chip timer		
TL	: TRACK LOSS of the TDA8808 combined with the radial error signal of the TDA8809		
TMOUT	: TRAY MOTOR OUT		
TRAY	: tray open/close signal

7 DIAGNOSTICS

7.1 TROUBLESHOOTING AND REPAIR

This section contains some guides to aid the technician in troubleshooting the CDI player. The CD servo section and Analog Audio section are similar to any CD player. Thus, the same techniques for troubleshooting a CD player may be used. Added features in servicing the CDI player is the Low Level Test and the Service Shell, see section 5." Service Software". The Low Level Test needs a VT100 terminal(or equivalent) or a Service PCB as an extra tool to run and test the functioning of the MMC section . The Service Shell provides tests for the Analog Video, CD Servo, and Analog Audio circuits. Section 5.3 covers all the Service Shell test procedures.

All circuit board assemblies can be serviced to the component level except the MMC section. Due to the complexity of the MMC circuit, replacement is recommended when defective. The CDM-9 CD Mechanism is also replaced as an assembly. Disassembly instructions are provided on the exploded views.

Troubleshooting hints:

Symptom: Service Shell cannot be started with the test plug.

Possible fault: Connections between port 1 and Slave Microprocessor may be bad. Test plug could be wrong. Slave Microprocessor may be defective.

Hint: If the Player Shell cannot be started, perform the Low Level Test (LL TEST).

7.1.2 Troubleshooting and Service the MMC parts

The monoboard is replaced as a module when parts of the Multi Media Controller are defective. The technician must know the functions of the MMC parts to diagnose a CDI player. The CDI player contains some built-in diagnostics to aid in troubleshooting. One diagnostic tool is the Service Shell (see section 5.3) and the other is the Low Level Test or LL Test (see section 5.2). The LL Test should be performed if there is access to neither the Player Shell nor the Service Shell. If the Low Level MMC test indicates a fault, replace the complete monoboard. If the test Cannot be initiated, check the power sources and main clock signals on the MMC section. If all supplies and clock signals are present, replace the MMC Unit.

7.1.3 Servo part and Audio Section Troubleshooting

A problem in the CD-I player can be isolated to a particular circuit by carefully observing the symptoms. For example, if there is no audio, but a picture from a CD-I disc is displayed, it is obvious that the CD Servo and decoding circuits are functional. Therefore the fault can be isolated to the audio decoding circuits only. Or the symptom may be opposite, the audio circuits may be working, but not the video. Again, the servo circuits must be functioning. Troubleshooting of the video decoding should then be followed.

When there is a symptom indicating a fault in the Servo circuitry, troubleshooting techniques used in CD players can be followed since the CD Unit portion of the CD-I player is basically a CD player (refer to the CD Unit schematic diagrams in the service manual).

If the CDM does not start, check for Vdd, clock, and reset on the CD Drive Microprocessor. If these signals are present, perform the X-bus test in the Service Shell or Low Level test. Also check for activity on the X-bus and SPI-bus. If there is a communication failure, proceed with the MMC Low Level Test to determine if there is a failure in the system control circuitry. If the communication buses are functional, check the CD servo circuits using the Service Shell test modes. These modes are the standard CD servo test modes to test the OPU, turntable and swing arm. If there is a failure in the servo test modes, further checks with measurements on the CD panel (see section 7.2.2) should reveal the fault .

If the servo circuits are functioning, check the decoder circuits. Activity should be seen on the I²S (DAAB, CLAB, and WSAB) and subcode (SCAB and SDAB) lines from the SAA7310 Decoder IC. If there is no activity, check the supply (Vdd) and input signals (HF, XIN).

If there is activity, check the ADOC circuitry.

When the servo and decoder circuits are functioning properly, there may be a problem in the Analog Audio circuit.

7.1.4 Video Section Troubleshooting

The symptoms displayed can help the technician isolate the problem to a particular circuit. The following examples illustrate how a fault can be isolated.

Symptom 1: the player shell is displayed, but video from the disc cannot be displayed. If this condition exists, the Digital Video section and video analog circuits are functioning. Since the player shell is displayed, the video synthesizer circuit is functioning. However, there must be a fault on the MMC section, since this is where the video decoding takes place. Thus the problem is isolated to the video decoding section on the MMC section.

Symptom 2: no video. This symptom may be caused by either the DigitalVideo part or by the Analog Video circuit. A few voltage and signal measurements can quickly isolate the problem. Hint, also check all the video outputs: S-video, RF, and CVBS. If video is not present from any output, check the RGB, composite sync, and power source inputs. If these signals are present, the Digital Video circuits are functional. Further checks of the Analog Video circuit can isolate the problem further. Check the Video Encoder IC. Also check Vcc1 and Vcc2 to the Video Encoder IC.

Symptom 3: no color. This symptom is most likely caused by a problem in the ENCODER circuit. Check the subcarrier oscillator at Pin 6 of the Video Encoder IC. If this signal is present (correct frequency), check the chroma output signal at Pin 15. If there is no chroma output, IC7609 may be the fault. Also check for short circuits between pins of the IC. If the chroma is present, check the chroma input at Pin 17. If the chroma is not present here, check the coupling components between Pins 15 and 17. If there is chroma at this point, check the composite output at Pin 20. If the chroma is missing, suspect the Video Encoder IC (IC7609).

7.2 MEASUREMENTS & ADJUSTMENTS

In the circuit diagrams and on the drawings of the panels measuring points are marked with :

Some times signals to be measured are pointed as for example : IC7181pin1.

All DC signals are measured with an universal electronic voltmeter.

All AC signals are measured with an oscilloscope

7.2.1 Powersupply section

The main signal in this section is the +5V, to be adjusted with potmeter 3807 up to 5,3 V

All other signals are stated in the circuit diagram

7.2.2 Servo section

7.2.2.1 Lasercurrent.

The lasercurrent is adjusted in the CDM9 and is a factory adjustment. After replacing a defective CDM the laser current does not need to be adjusted.

Play track 1 of testdisc 5, the voltage accross item 3411 (measuring point 1 and point 2) on the CD panel should be : 0,7 V / DC $\pm$ 10 %.

7.2.2.2 Focus signal.

Play track 1 of testdisc 5, the voltage accross item 2431 (measuring point 3 and GND) on the CD panel should be : + 400 mV / DC $\pm$ 10%.

7.2.2.3 Starting signal.

Insert a disc and measure accross item 2409 (measuring point 4 and GND).

After pushing the play button the next picture appears on the oscilloscope :

The signal is triggered by the Si/RD signal on IC7401pin6.

7.2.2.4 Motorcontrol signals.

Insert testdisc 5.

Measure accross IC7445A pin3 and GND, after pushing the play button the next picture should appear on the oscilloscope.

After a while, when playing track 1, the voltage should be : - 1.7 V DC $\pm$ 10%

Play track 1 of testdisc 5, the voltage accross measuring point 6 and ground should be : 3.2 Volt DC $\pm$ 10%

Signal accross measuring point 7 and GND should be :

7.2.2.5 Radial error circuit signals.

Voltage accross measuring point 18 and GND : 2,6 V / DC $\pm$ 10%.

Voltage accross measuring point 19 and GND : 110 mV / DC $\pm$ 10% in PLAY mode.

Voltage accross measuring point 21 and GND : 1,2 V / DC $\pm$ 10% in PLAY mode.

Voltage accross measuring point 22 and GND :

Voltage accross measuring points 23, 24, 26 and 27 depending on playing mode, 0V if LOW or 5V if HIGH

For measuring point 28 and 33 put the player in the service shell on CD drive test mode 2. The voltage across point 28 and GND should be :

7.2.2.6 Clock signal μP IC7475

Measuring point 29 : clock signal $f = 4\text{MHz}$.

7.2.2.7 Decoder signals

Play track 1 of testdisc 5.

The signal across measuring point 31 and GND should be:

Insert testdisc 5 and put the player in the service shell on CD drive test mode 2.

The signal across measuring point 32 should be :

Measuring point 34 : clock signal $f = 11.289.600\text{ Hz}$.

Voltage across measuring point 36 and 37 :

$775\text{ mV/DC} \pm 10\%$

Measuring points 38 : LOW. If the blackdot track of testdisc 5A is played then pulses activity should be measured on this point.

Measuring point 39, 41 and 42 :

7.2.3 Audio section

Select the submenu "APU/KEY" of the Service Shell, see section 5.3. With this menu we can check besides the remote control functions also the audio functions **L-R** and **mono/stereo**. This audio function can only be checked when an audio-disc is inserted. When any disturbances occur, the following checks/measurements can be performed ($2 \div 8$).

Required test discs:

Use an arbitrary Digital Audio disc in the **service shell**, submenu **APU/KEY**.

Testdisc no. 5 - 5A (4822 397 30096 - SBC 426)

Use launch disc or arbitrary CD-I disc which contains audio levels A-B-C and/or CD-DA.

Audio signals disc (4822 397 30184 - SBC 429)

7.2.3.1 Slave processor data

Check whether the signals appear on test/measurements points 66 $\div$ 69 (connector A11 pin 1 $\div$ 4) from the slave processor.

66 - CLKDAC

67 - DATADAC

68 - CSDAC1N Pin15 of IC7550

69 - CSDAC2N Pin15 of IC7530

These signals are very hard to recognize on an oscilloscope during the normal application. Only in the **service shell** and controlling the attenuators you can observe activity .

If there is any activity on one of the lines 66 $\div$ 69 one can suppose that the information of this signals are oke.

This is also to be considered for the data lines D0 $\div$ D7.

If no disturbances, check the data outputs D0 $\div$ D7 of IC7512.

7.2.3.2 I²S signals

Check whether the signals, given below, appear on the test points 57 - 58 - 59

Time base related only to CD-DA.

7.2.3.3 Xin clock signal

testpoint 61

Play a CD-DA track.

The frequency of the Xin signal must be:
11,2896 MHz (CD-DA.)

Play CD-I audio.

The frequency of the Xin signal must be:
9,767 MHz for CD-I level A and CD-I level B;
4,838 MHz for CD-I level C.

7.2.3.4 DEEMP signal

(testpoint 56)

Insert test disc 5 or 5 A and during track 14 (recorded without pre-emphasis) the signal DEEMP should be low.
(0 V.)

During track 15 (recorded with pre-emphasis) this signal DEEMP should be high (+ 5V.)

7.2.3.5 KILL signal

(testpoint 54)

This KILL signal must be +12V during reset.
In normal/play position this signal is - 8 V.

7.2.3.6 Performance check APU

Position digital audio

- Insert Audio signals test disc 1, SBC 429
- Play track no. 1. (1kHz sinus signal L + R 0dB)
- The level on pin7 and pin8 of IC7531 should be:
0.9 Vrms $\pm$ 2dB
- The level on testpoint 71 and 72 should be:
2 Vrms $\pm$ 3dB.

7.2.4 Video section

Required test equipment.

- Electronic voltmeter
- Oscilloscope
- Frequency counter

Put the player in the service shell on testimage (colorbar).
signals : BSW!, GSW!, RSW! At pos 7622, 7621 and 7620

Measuring point 86, 87 and 88:

Measuring point 91:

Measuring point 92:

Measuring point 89:

Check of Output signals for CVBS - Y / C.

7.2.4.1 Check of subcarrier .

- Player switched off.
- Connect frequency counter to testpoint 83 ,(Pin 6 IC 7609) and turn on the player.
- The frequency on testpoint 83 should be;
PAL = 4 433 618 Hz. ± 50 Hz.
NTSC = 3 579 545 Hz. ± 7 Hz.
- The amplitude on testpoint 83 should be in between;
400 mV and 1000 mV_{pp}
- If for PAL the frequency of this signal deviates, perform alignment of trimmer 2650.

CVBS signals Testpoint 89

Video signal	1000 mV _{pp}
White level	710 mV _{pp}
sync	290 mV _{pp}
Burst	290 mV _{pp}

7.2.4.2 Check of standard control signal SW

The control signal SW on testpoint 78, should be low (0 V) for PAL and high (5 V) for NTSC.

7.2.4.3 Check of RGB input signals

On the given photo below the signals are given for R - G - B.
On Testpoints 86, 87 and 88.

Y/C Sign. Testpoint 91/92

Video signal	1000 mV _{pp}
White level	710 mV _{pp}
sync	290 mV _{pp}
Chroma	300 mV _{pp}

7.2.5 Multi Media Controller section

Required equipment:

Multimeter
Display terminal type
Digital
VT100 or equivalent
Digital oscilloscope
Analog oscilloscope
Timer/counter

7.2.5.1 Supply voltages

Check if the following voltages are present at connector 1001

pin1,2,3 : +5 V $\pm$ 5%
pin4 : -5 V $\pm$ 5%
pin5 : +25 V $\pm$ 5%
pin6,7,8 : GROUND

7.2.5.2 Clock signals:

Carry out measurements just after hardware reset.

This is done each time after pressing the OPEN/CLOSE button or after power-on.

System clock

30.0000 MHz $\pm$ 1500 Hz (PAL)
30.2098 MHz $\pm$ 600 Hz NTSC)

This system clock must be present at the following points:

IC7201 pin 30
IC7304 pin 80
IC7125 pin 115

At IC 7201 pin 29 Clock divided by two must be present:

15.0000 MHz (=30.000 : 2).
15.1049 MHz (NTSC)

At IC7201 pin 69 the UART clock of 68070 must be present :

Frequency 4.9152 MHz $\pm$ 250 Hz

At IC7206 pin 39 clock of '68HC05' must be present :

Frequency 4.000 MHz $\pm$ 100 Hz

At IC7301 pin 94 the clock of the CDIC must be present :

Frequency 22.5792 MHz $\pm$ 1100 Hz.

At IC7306 pin 16 the DSP clock must be present :

Frequency 7.5264MHz $\pm$ 380 Hz

7.2.5.3 I²S interface:

FILTERN : 0V
DAAB
CLAB : frequency 2.8224 MHz(only for CD-DA)
WSAB : frequency 44.1 KHz (only for CD-DA)
DEEM : 0V (only for CD-DA and only if de-emphasis track is played)

7.2.5.4 Reset circuitry:

Press the OPEN/CLOSE button at front panel and measure the 'RESETCD' time (low!). This 'low' time must be 140 ms $\pm$ 20 ms. Also measure the RESETCD time(low!) if the button is released. The signal RESETCD must be low for 140 ms $\pm$ 20 ms.

IC7201 pin 28 RESETN; low time = 250 ms $\pm$ 20 ms

7.2.5.5 Check of microprocessor 68070.

Check after power on:

IC7201, pin 27 (= HALTN) = high (+5V)
IC7201, pin 28 (=RESETN) = high (+5V)
IC7201, pin 24 (=DTACKN) = changing high/low
IC7201, pin 26 (=BERRN) = high (+5V)

7.2.5.6 Low level test

Purpose is to test the hardware with software.

Connect a terminal, or Service PCB to the UART of micro-processor 68070 via connector at rear side port 2 (= BU-2).

How to start the low level test see section 5.2.

Settings of the terminal:

Baudrate : 9600
start bit : 1
data bists : 8
stop bits : 0
no parity/ no handshake

8 PARTSLIST

8.1 PARTSLIST OF THE CABINET
